Let’s connect

Luise Freese

- Independent Azure & Power Platform Architect
- Microsoft MVP
- M365princess.com

Robin Rosengrün

- Somehow ended up at Microsoft
- Used to be a Microsoft MVP
- Aka.ms/dppcc

Agenda

- 9:00 - Start
- Intro
- SharePoint vs. Dataverse
- Dataverse Build
- Coffee Break (10:30-11:00)
- Canvas Apps vs. Model Driven Apps
- Custom Page Demo
- Lunch Break (12:30-13:30)
- Custom Page Build
- Afternoon Break (14:30-15:00)
- Custom Page Best Practices
- AI Builder Demo
- Generative Pages Demo
- QA
- 16:30 - End

Important info

- WIFI: ecsconnect
- Password: communityrocks

- Repo: https://github.com/LuiseFreese/BizAppsSummit-2026 or aka.ms/ecs-power
- Instructions on how to use the Accounts:

Balancing Compliance and Usability for AI Apps in M365

AI features are rapidly being integrated into business apps built on Microsoft 365, Power Platform, and Azure AI Foundry. But as soon as these apps move beyond proof-of-concept, familiar questions arise:
Who can see what? Where does the data go? How do we control the prompts? What does ‘compliant’ even mean in a Copilot interface?

This session offers a practical guide to designing AI-powered business apps that respect enterprise compliance boundaries without sacrificing usability. You’ll learn how to classify data early, protect sensitive outputs, and avoid common pitfalls like overblocking or shadow AI.

We’ll walk through real examples, such as prompt-based approvals, document classification helpers, or AI-powered knowledge apps, and show how to implement the right mix of Purview, role-based access, and in-app transparency.

The goal: business apps that are secure, traceable, and usable from day one.

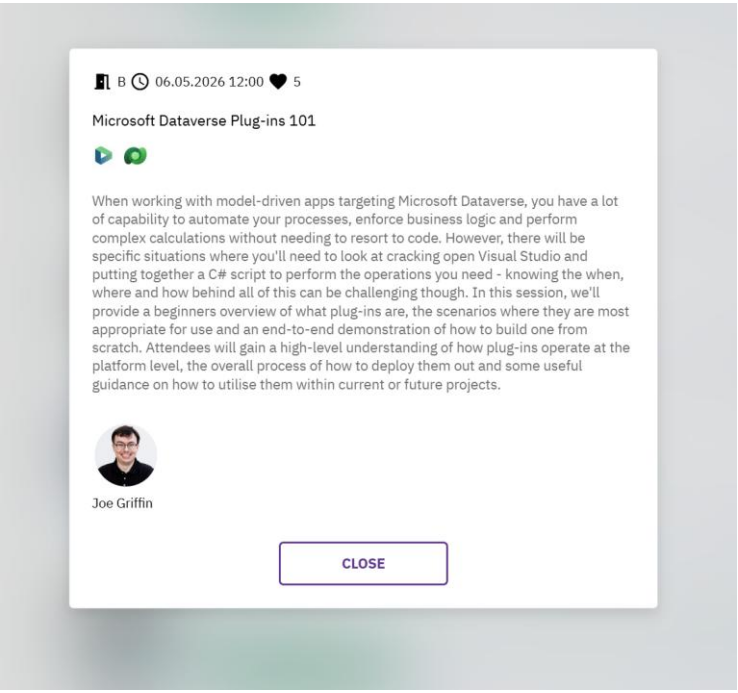
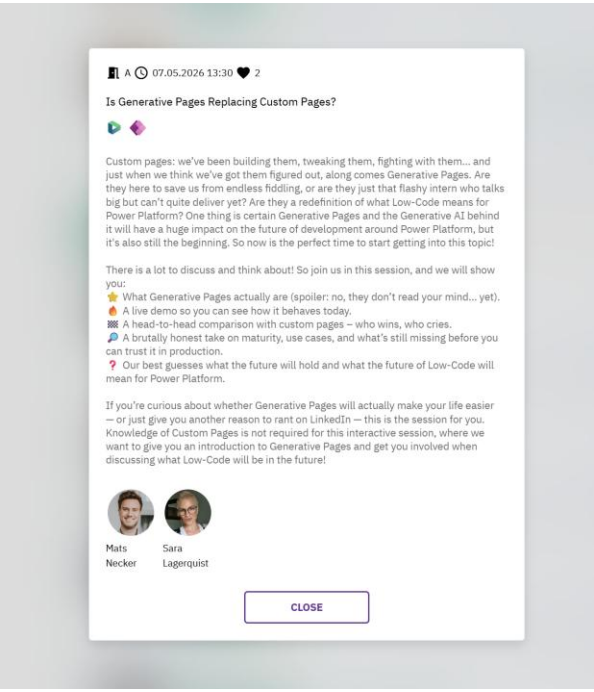
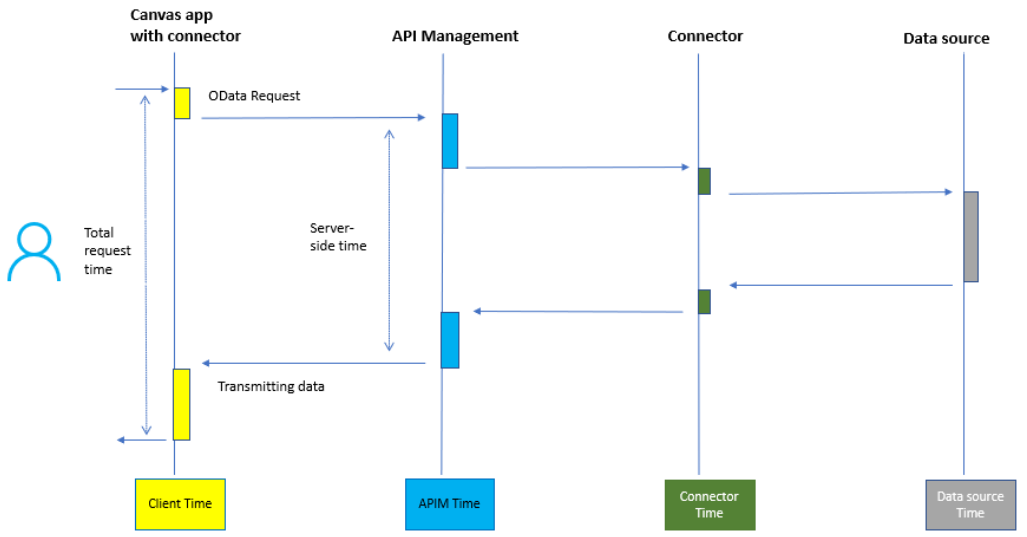
More recommended sessions



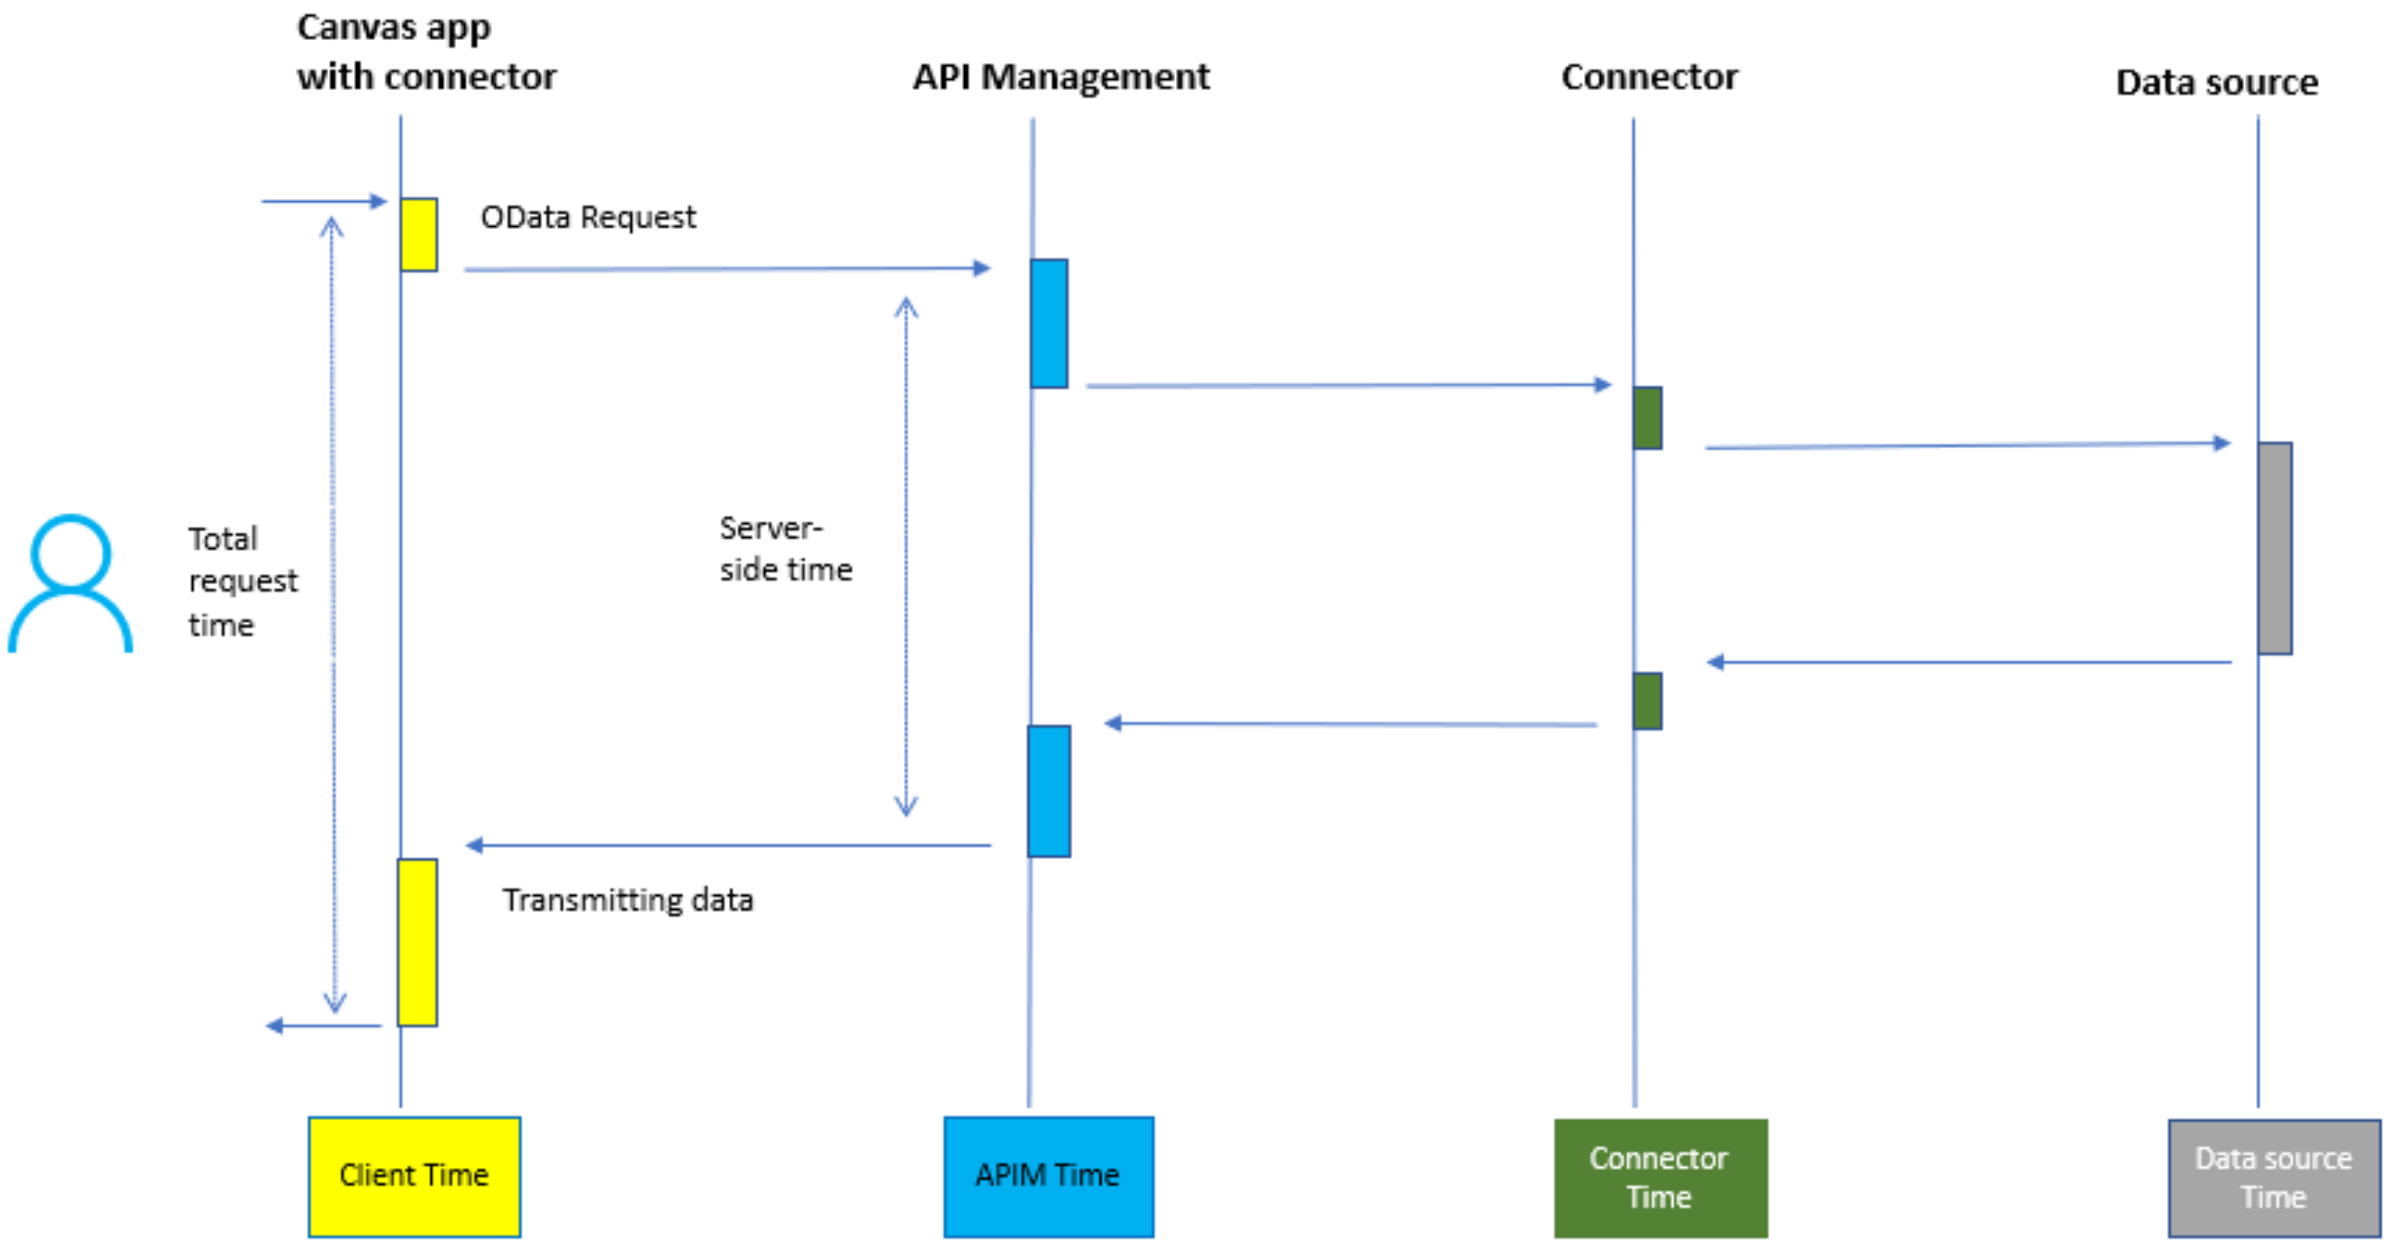


Typical data call flow

- Data request travels several server-side layers until it reaches the target data source
- Then it returns data to the client, passing again these layers



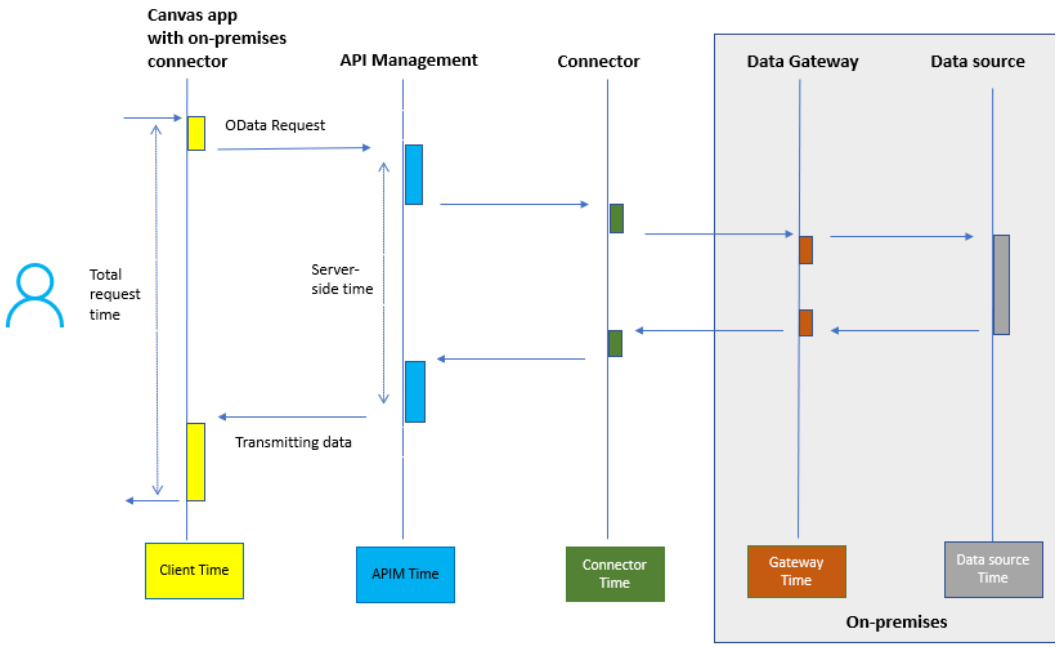
$$UX\ timetaken = \sum_{i=1}^{n}(Layer\ Time) + Transmission\ Time$$



$$UX\ timetaken = \sum_{i=1}^{n}(Layer\ Time) + Transmission\ Time$$

On prem data call flow

- Slowest option
- Data needs to travel through
  - APIM
  - the connector,
  - the data gateway
- to the data source - and then back



$$UX\ timetaken = \sum_{i=1}^{n}(Layer\ Time) + Transmission\ Time$$

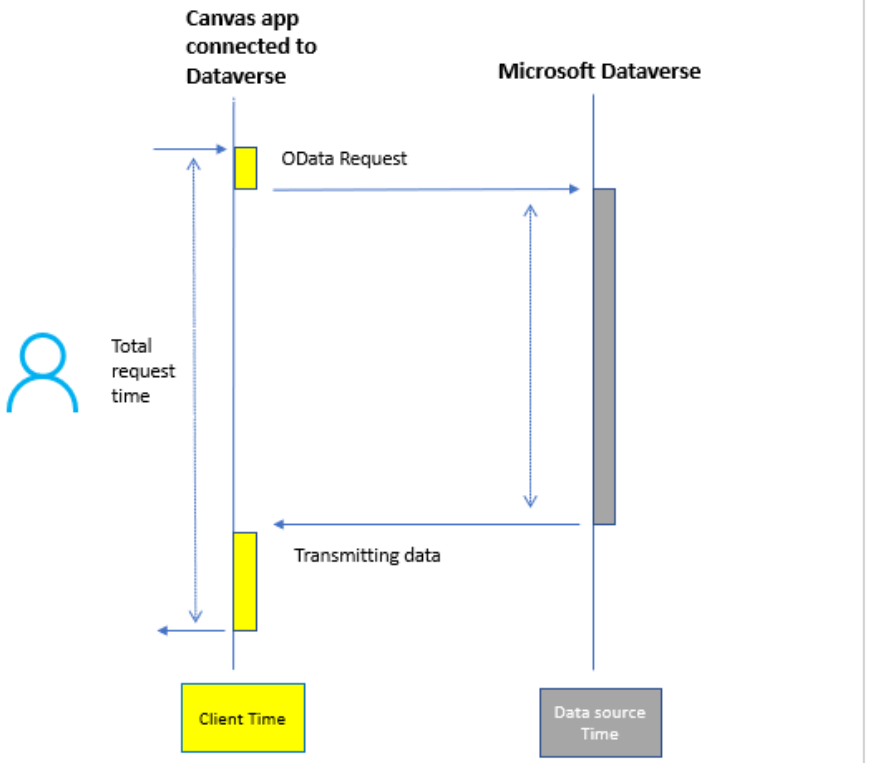
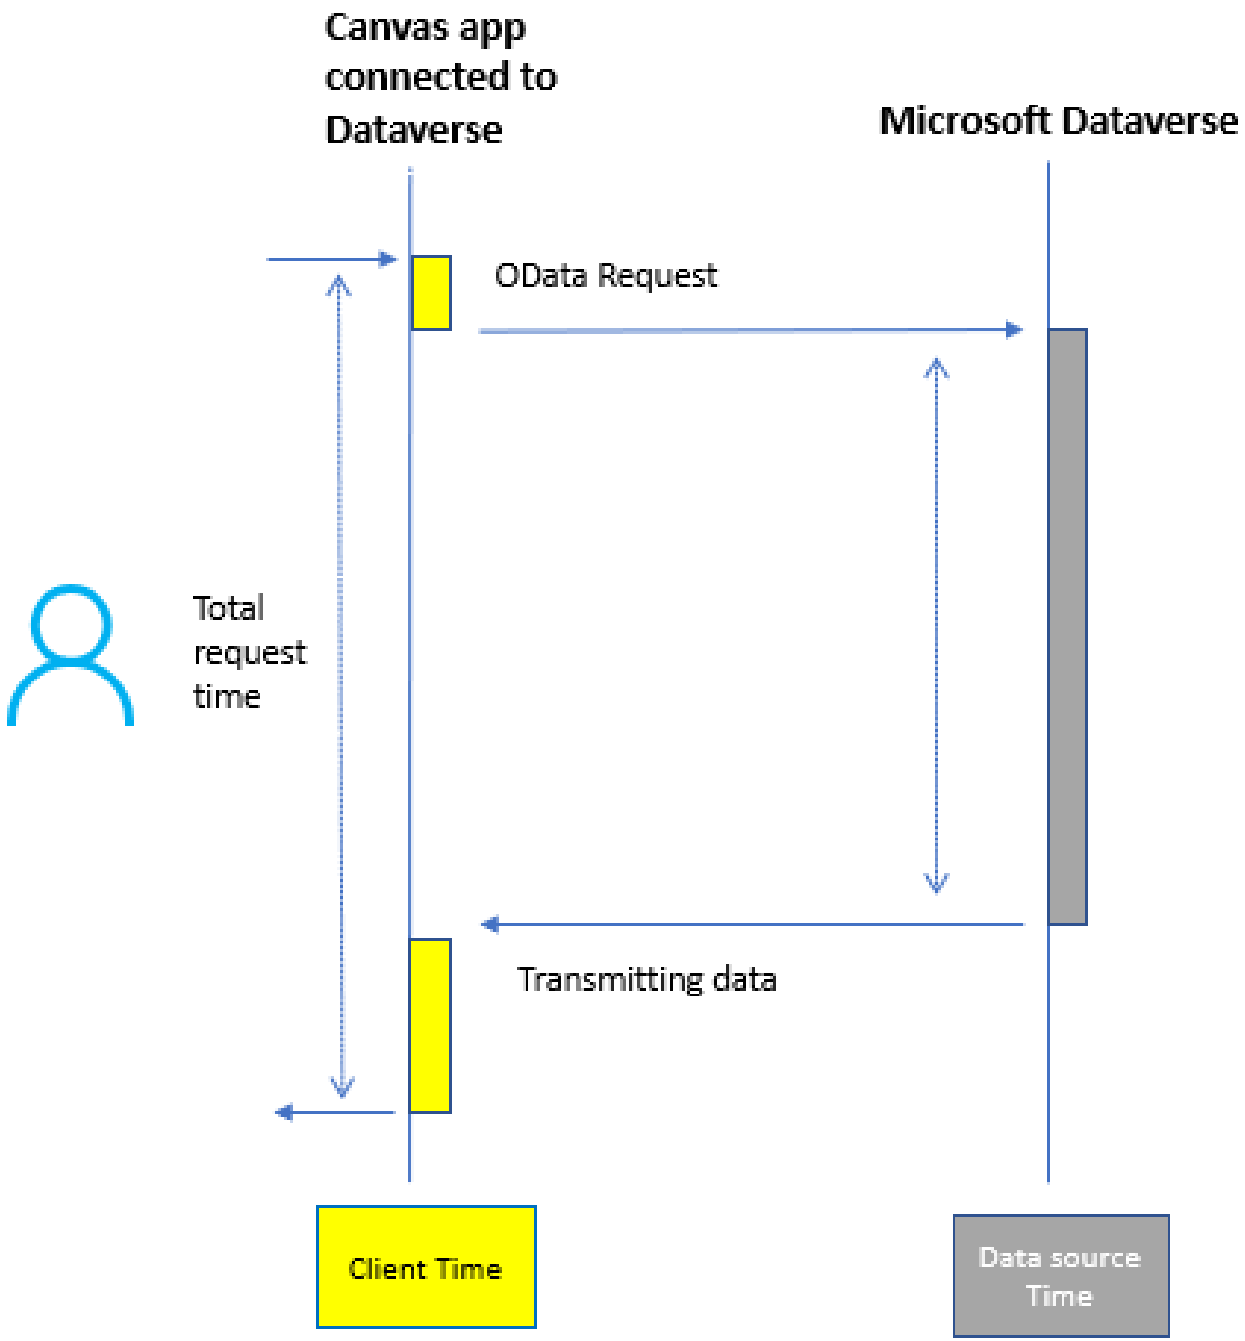
On-premises

Data call flow with Microsoft Dataverse

- Connect directly without passing through Azure API Management
- no connector, no gateway
- Fastest option



$$UX\ timetaken = \sum_{i=1}^{n}(Layer\ Time) + Transmission\ Time$$

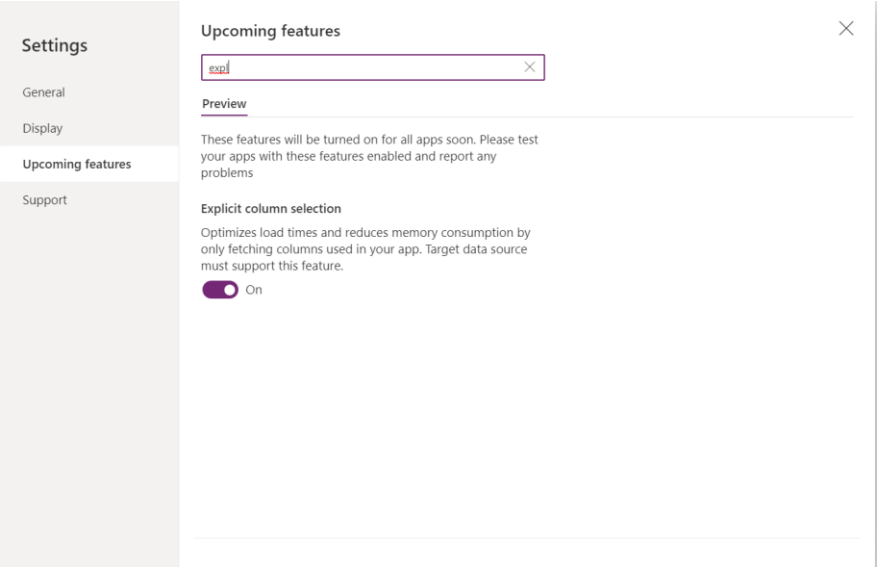


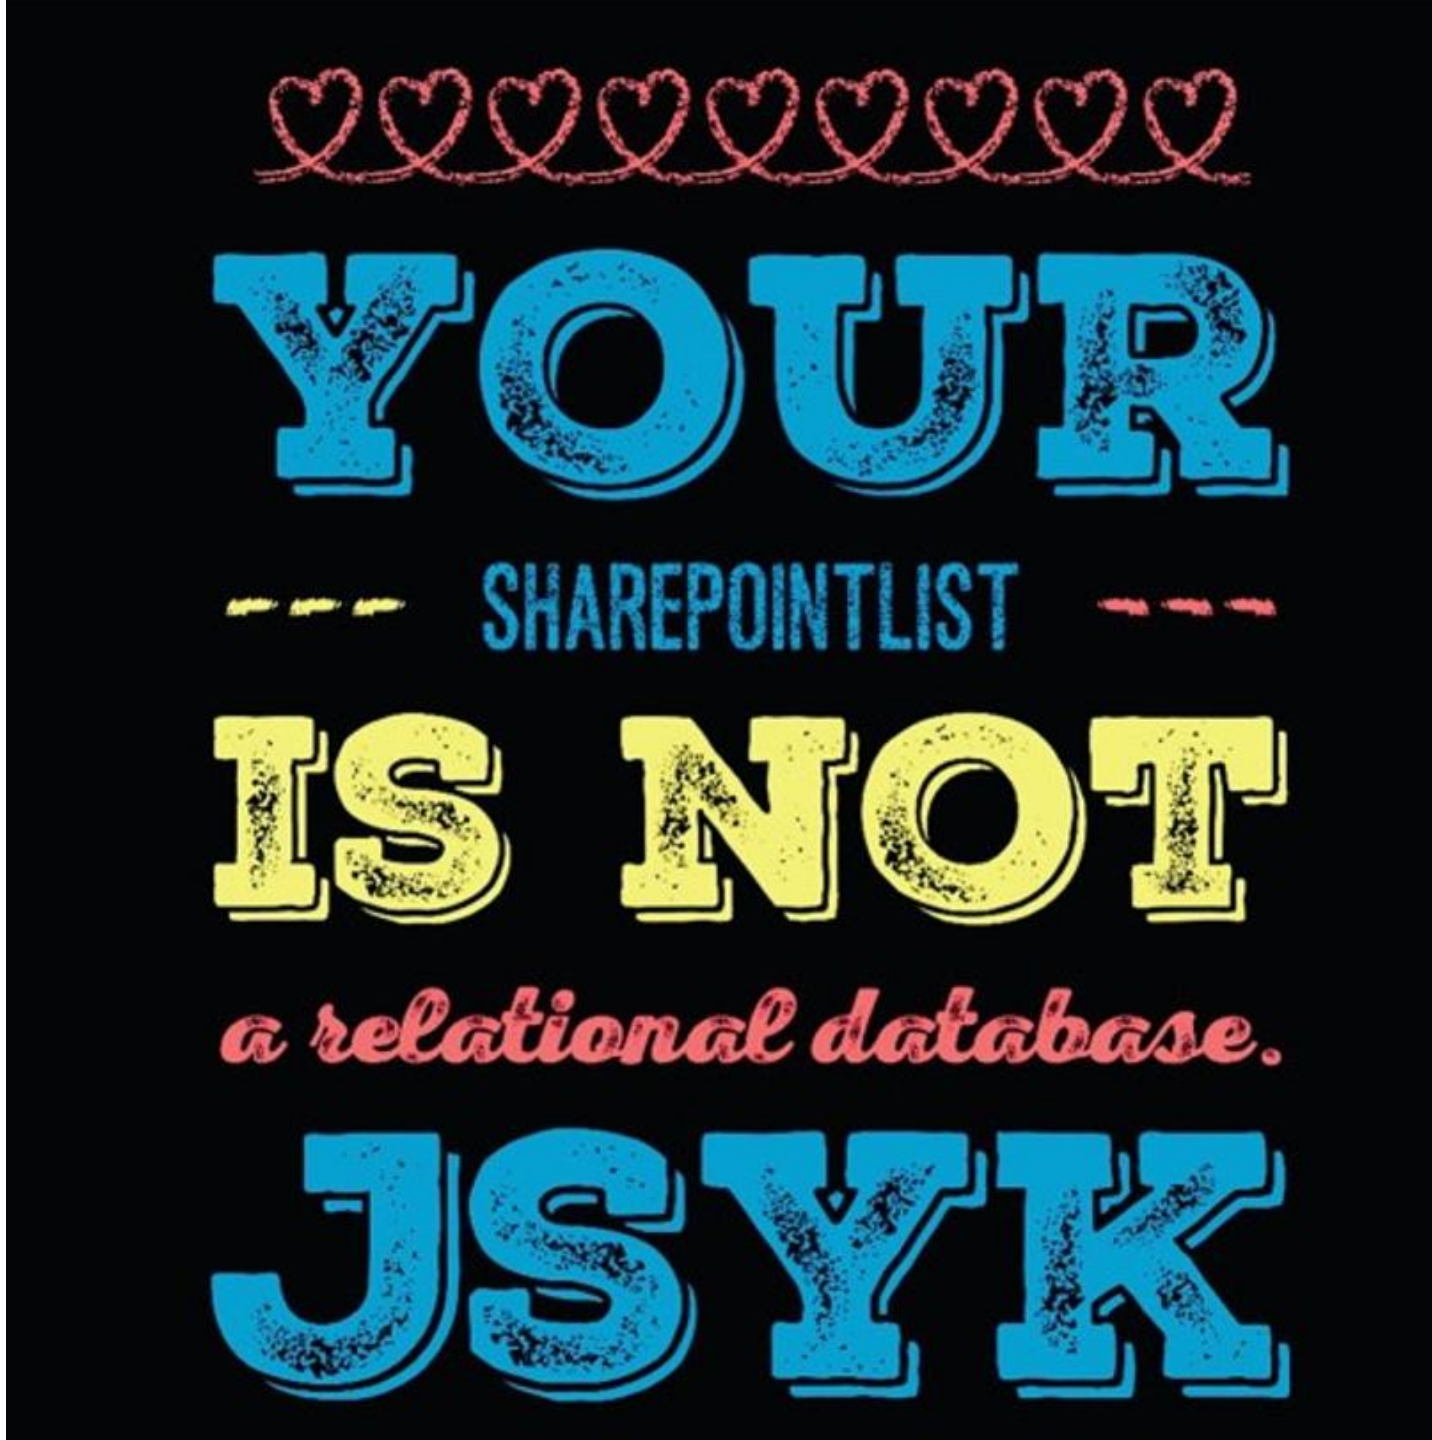
$$UX\ time taken = \sum_{i=1}^{n} (Layer\ Time) + Transmission\ Time$$

SharePoint

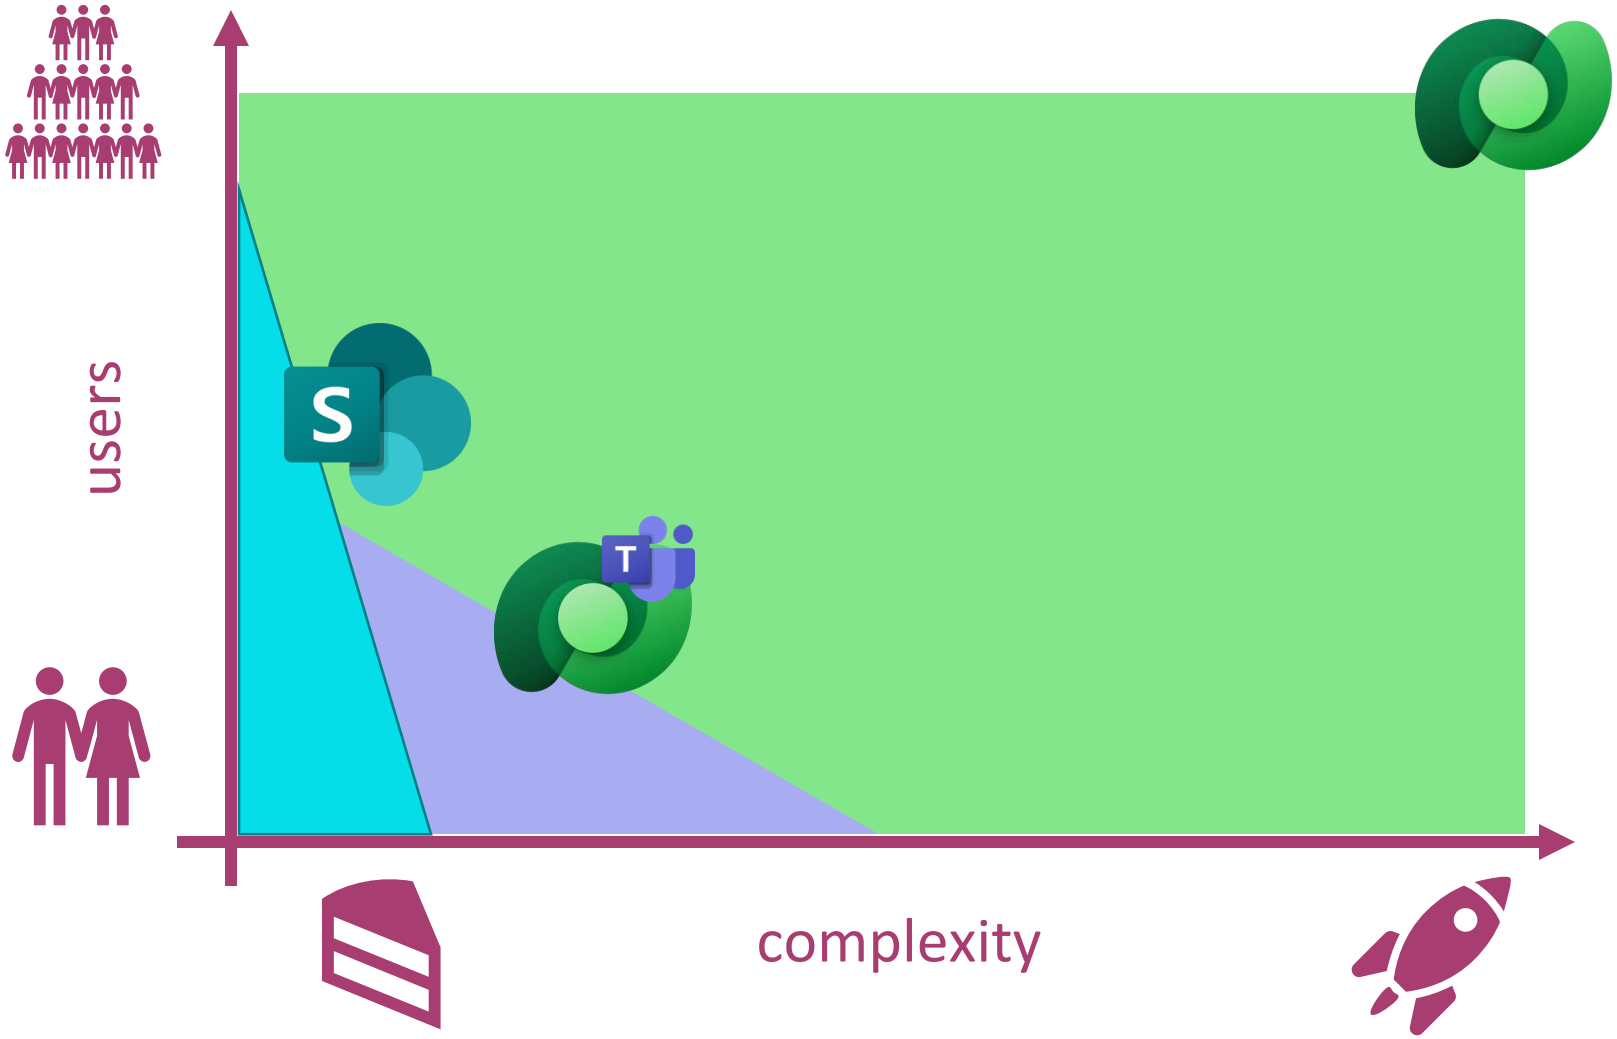
- Issues with
  - complex column types
  - attached files
  - large lists (items)
  - many columns

Tipp: Turn on explicit column selection



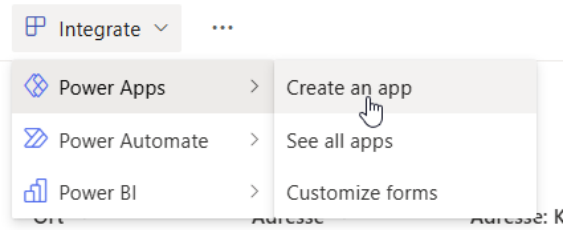


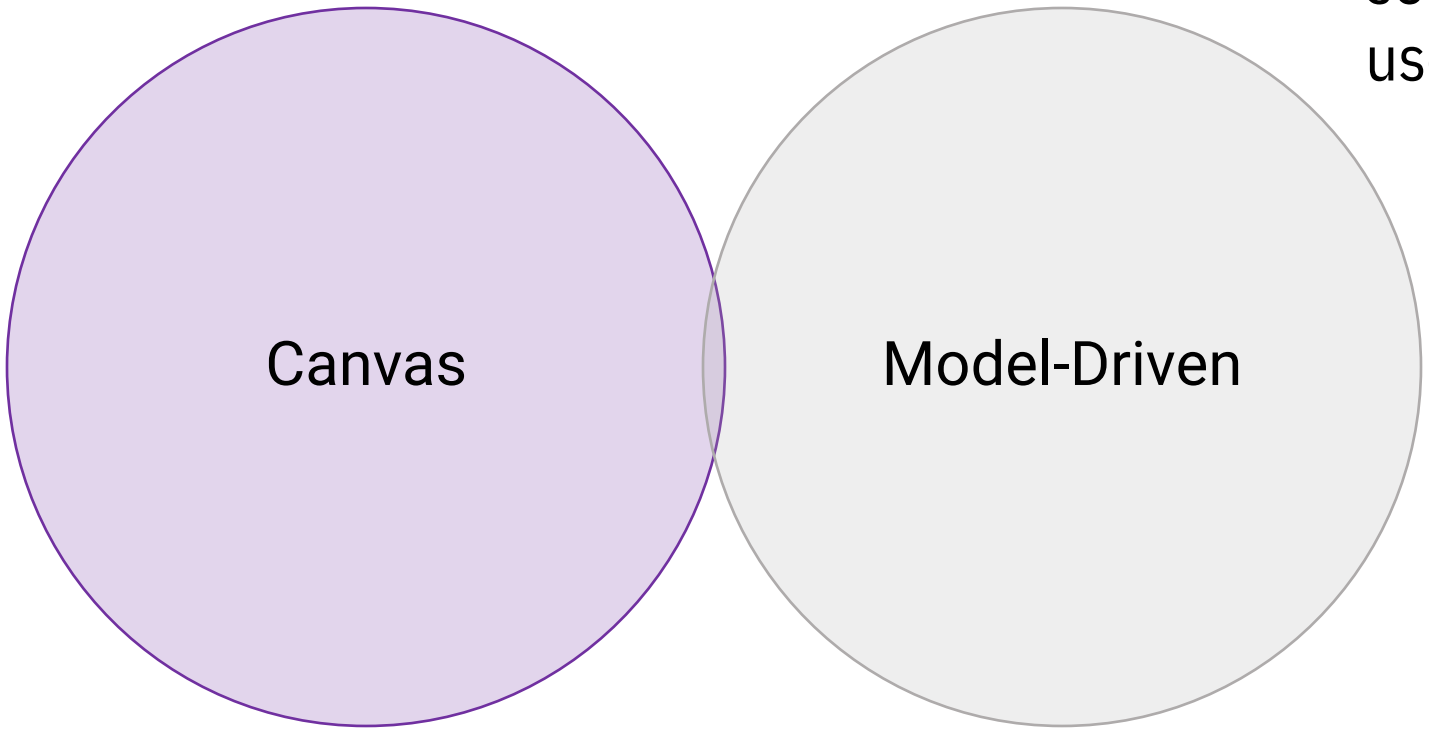
Discussion: When to use what



Power App(er)s 2020

The classic editor is so much easier to use



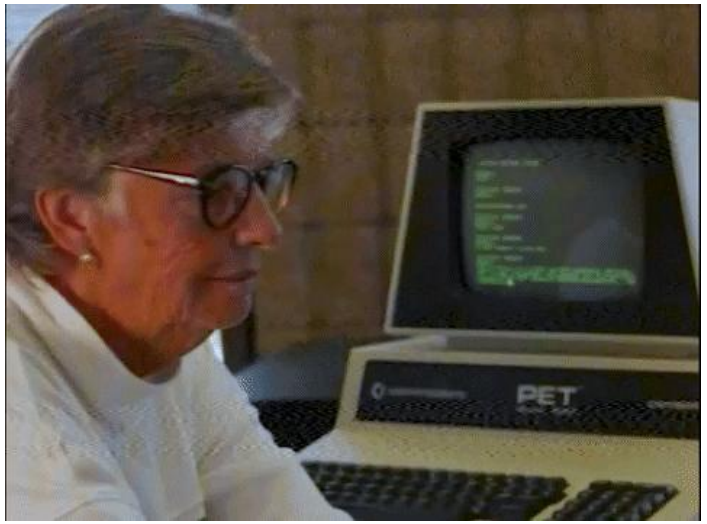


Model-Driven Apps

Canvas Apps

The truth about Canvas Apps

- We are building Business Applications
- Our Apps don’t need to be beautiful, but functional
- We don’t need a unique UX
- 95% of Canvas App Makers can’t create a UI that is better than a Model-Driven App



Model-Driven Apps

PROS

- Design standards
- Quick to create
- Lots of out of the box functionality

Canvas Apps

PROS

- Pixel perfect Apps
- Custom Logic with Low Code
- External Datasources / APIs

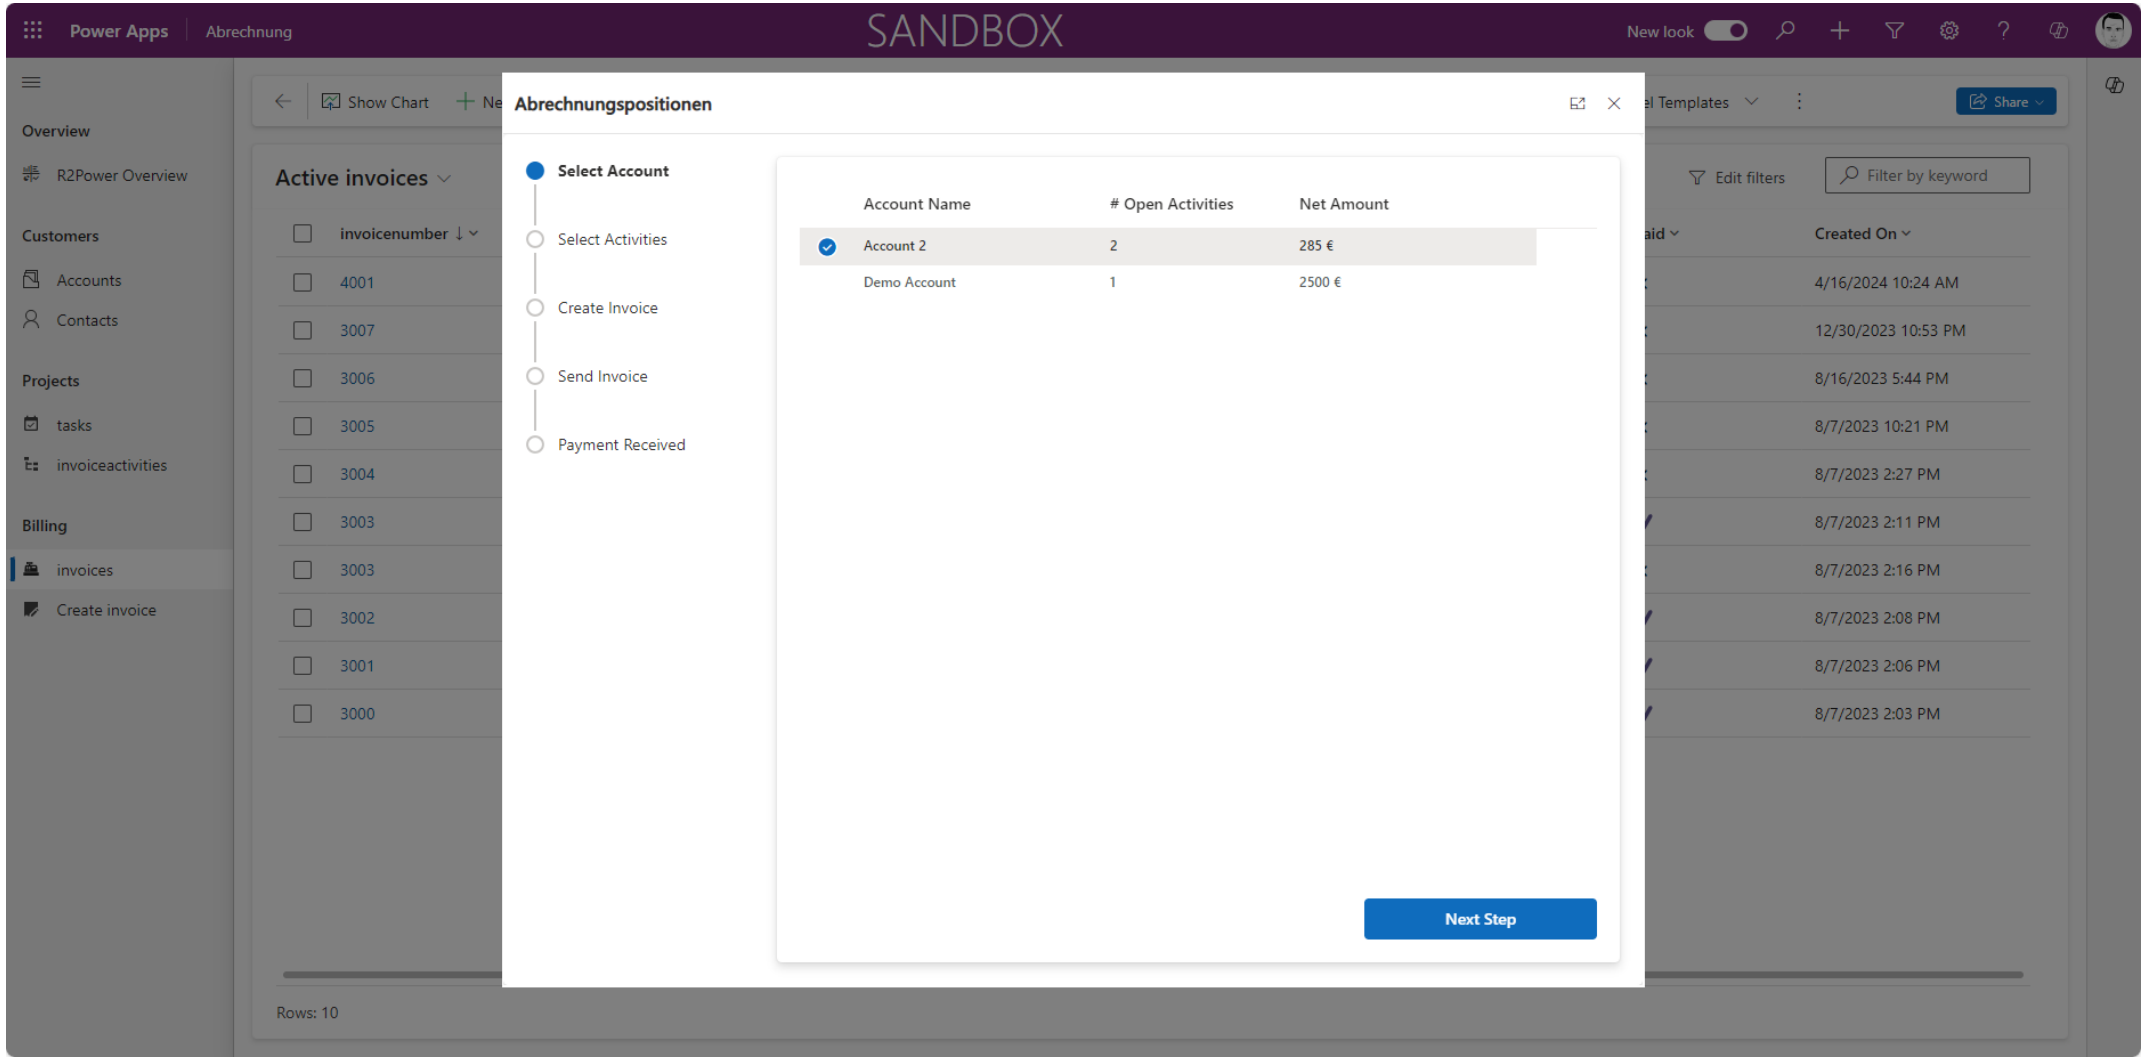
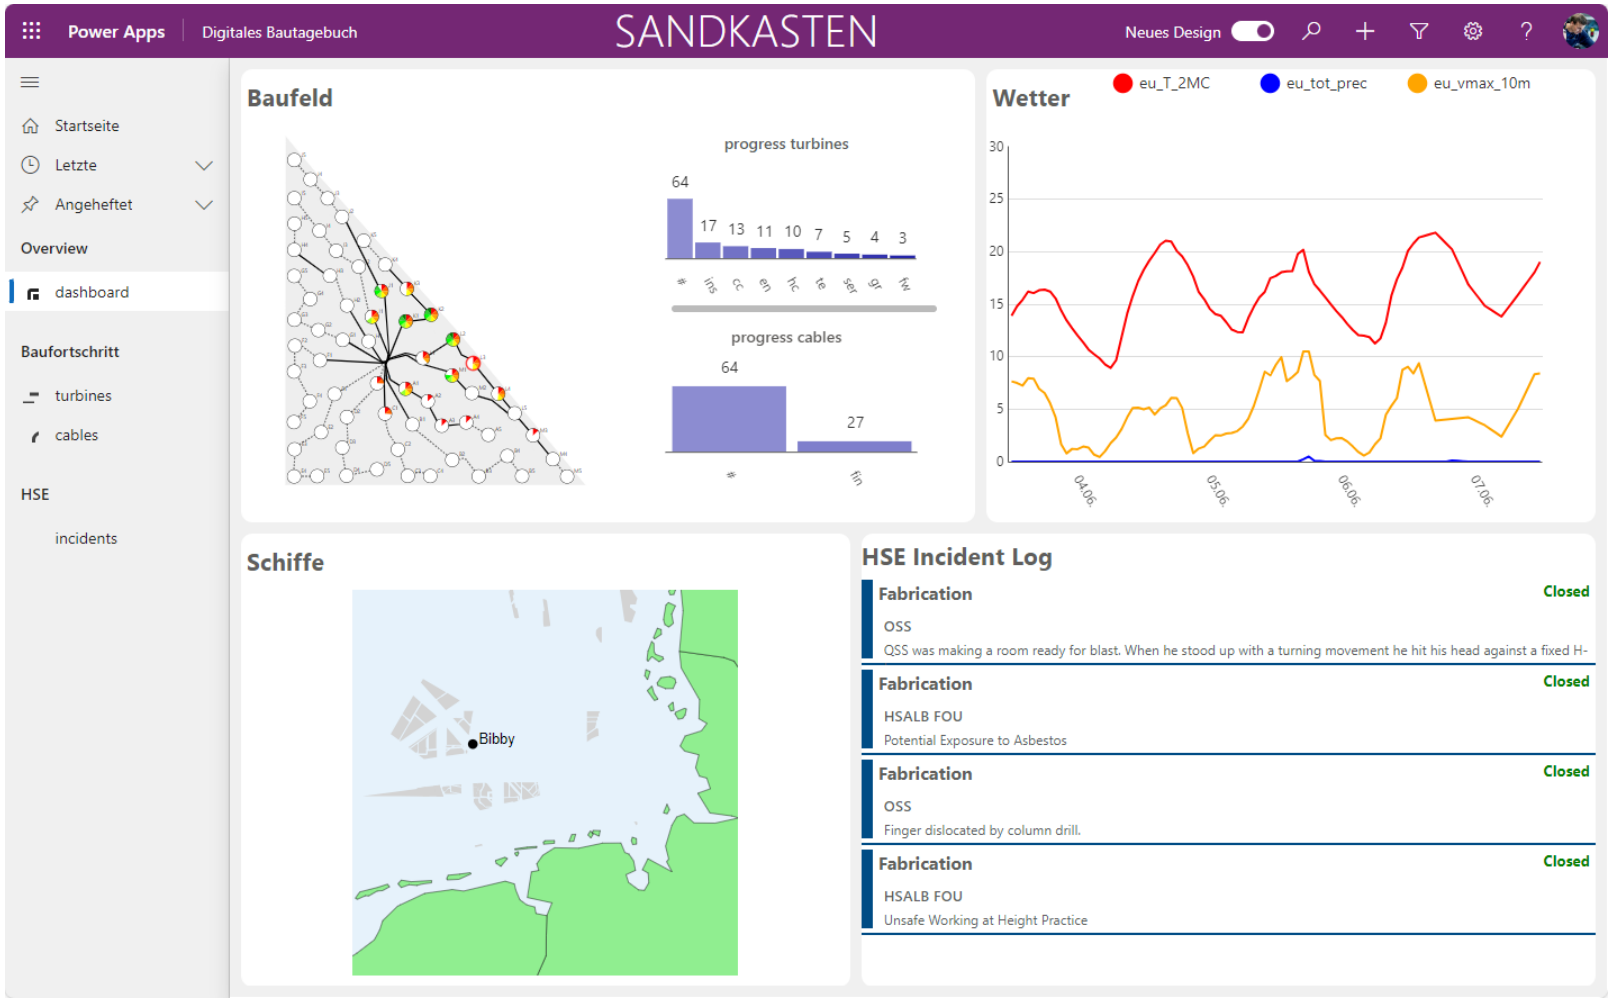
Examples

Examples

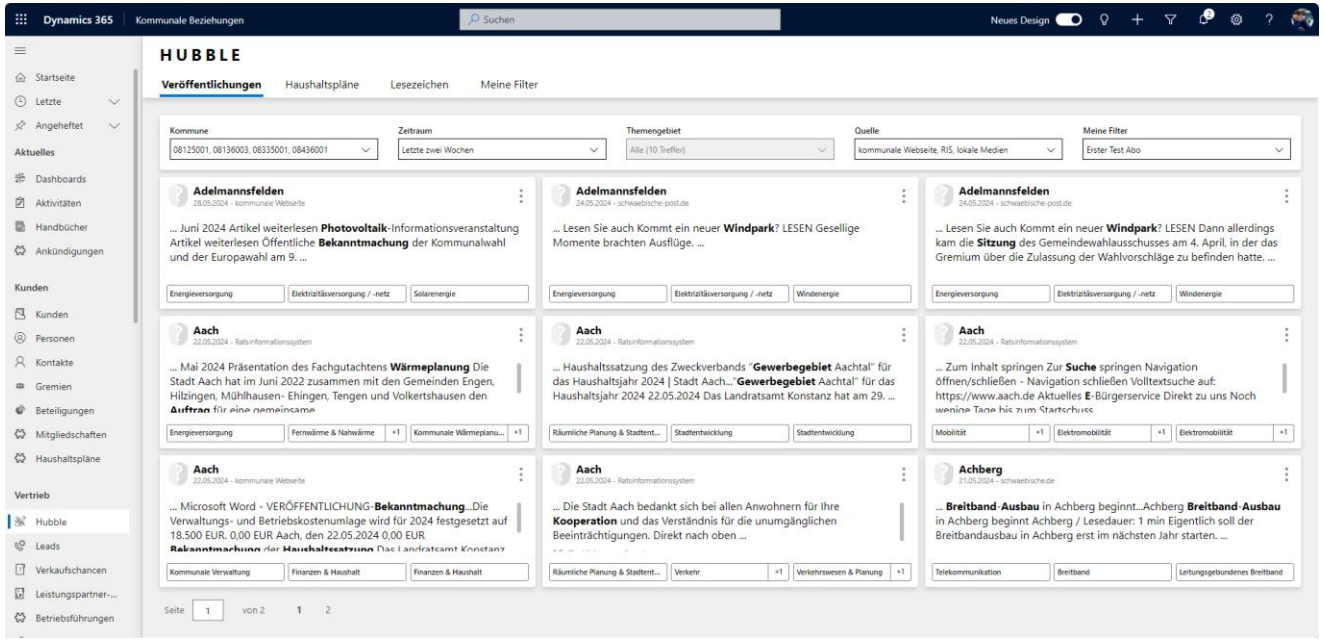
Examples – Invoice Creation

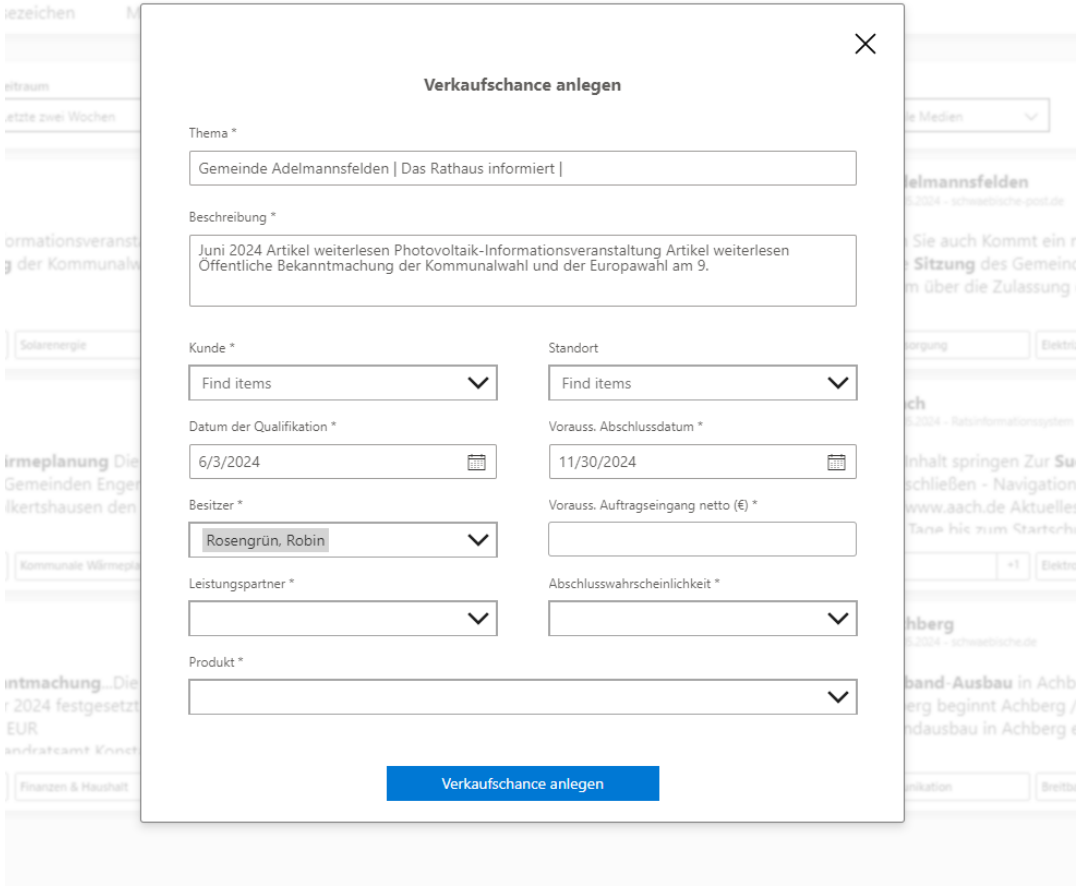


Examples – Dashboard with APIs

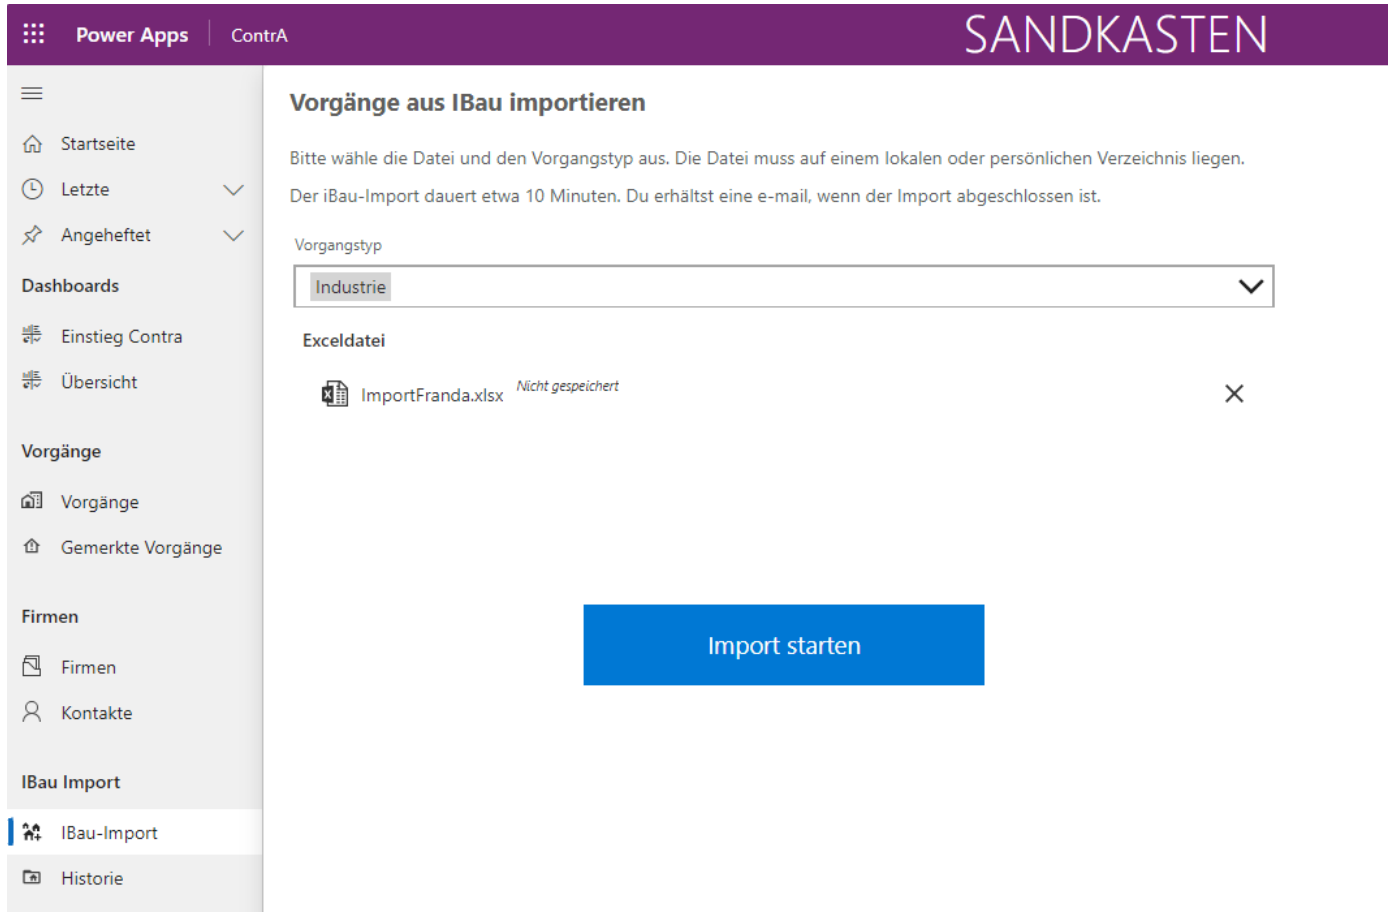


Examples – From web scraped data to Sales opportunities

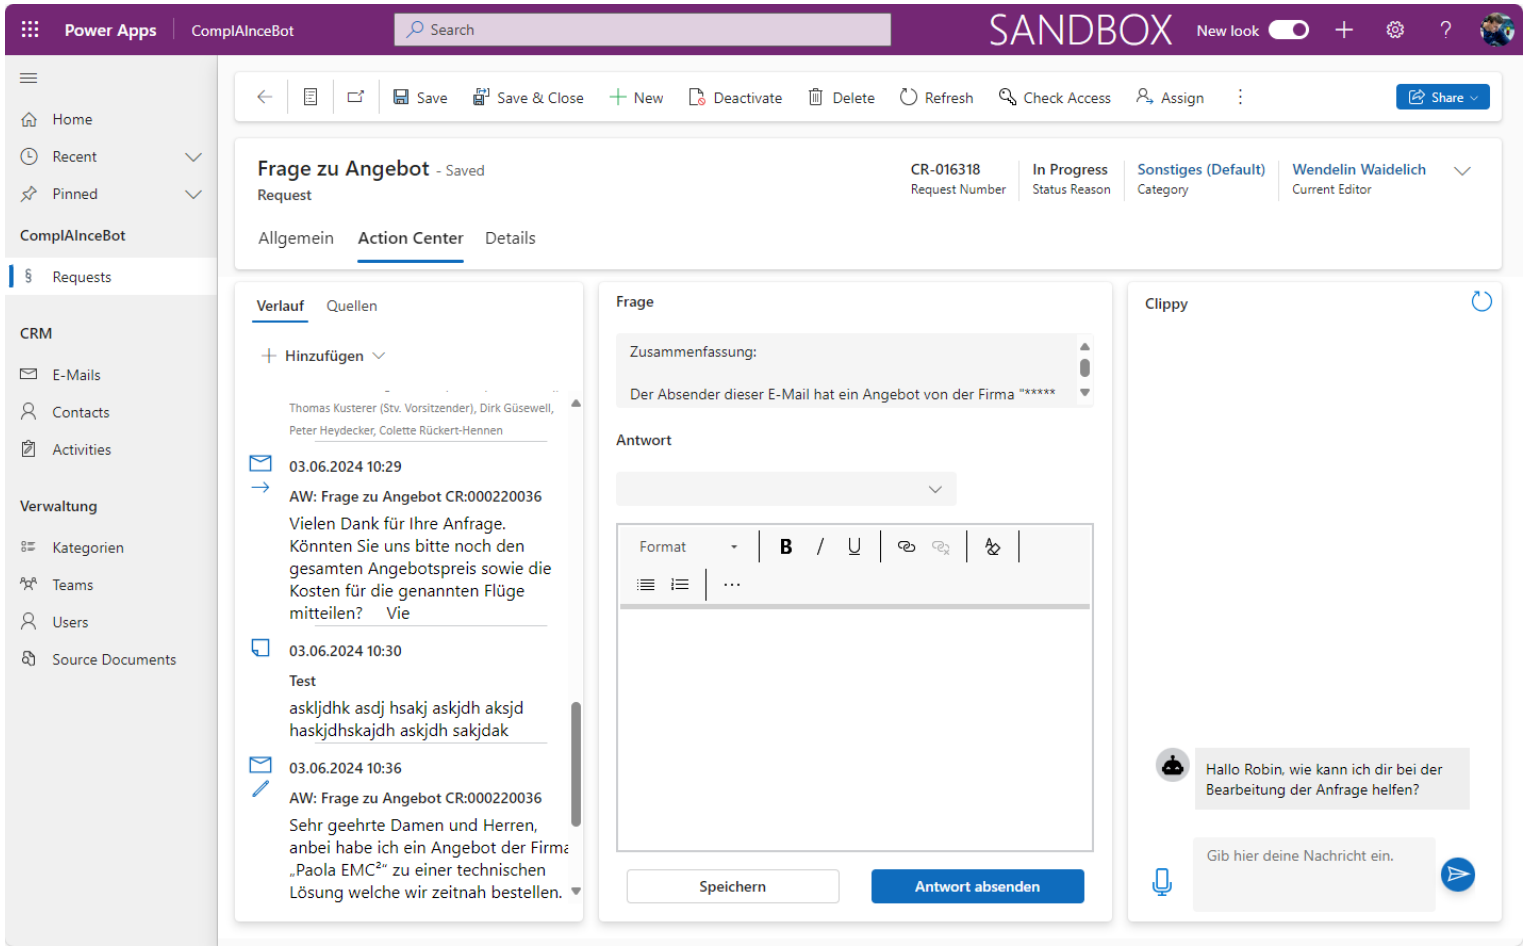




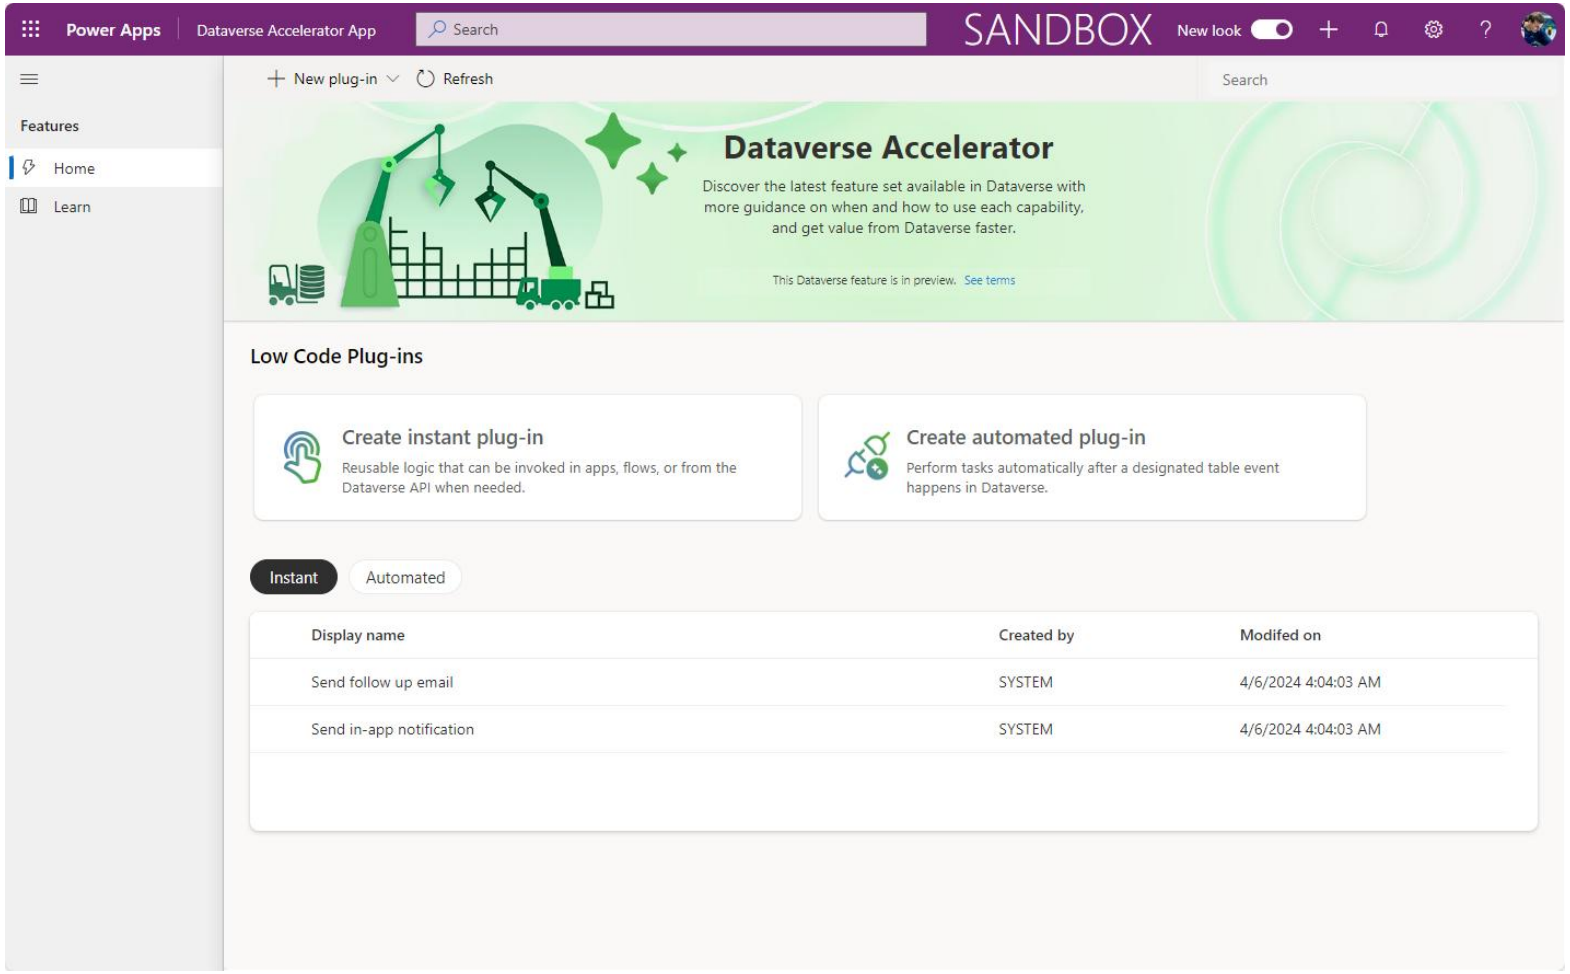
Examples – Import Excel files



Examples – Bringing GenAI into your Forms



Examples – EVERY APP FROM POWER CAT

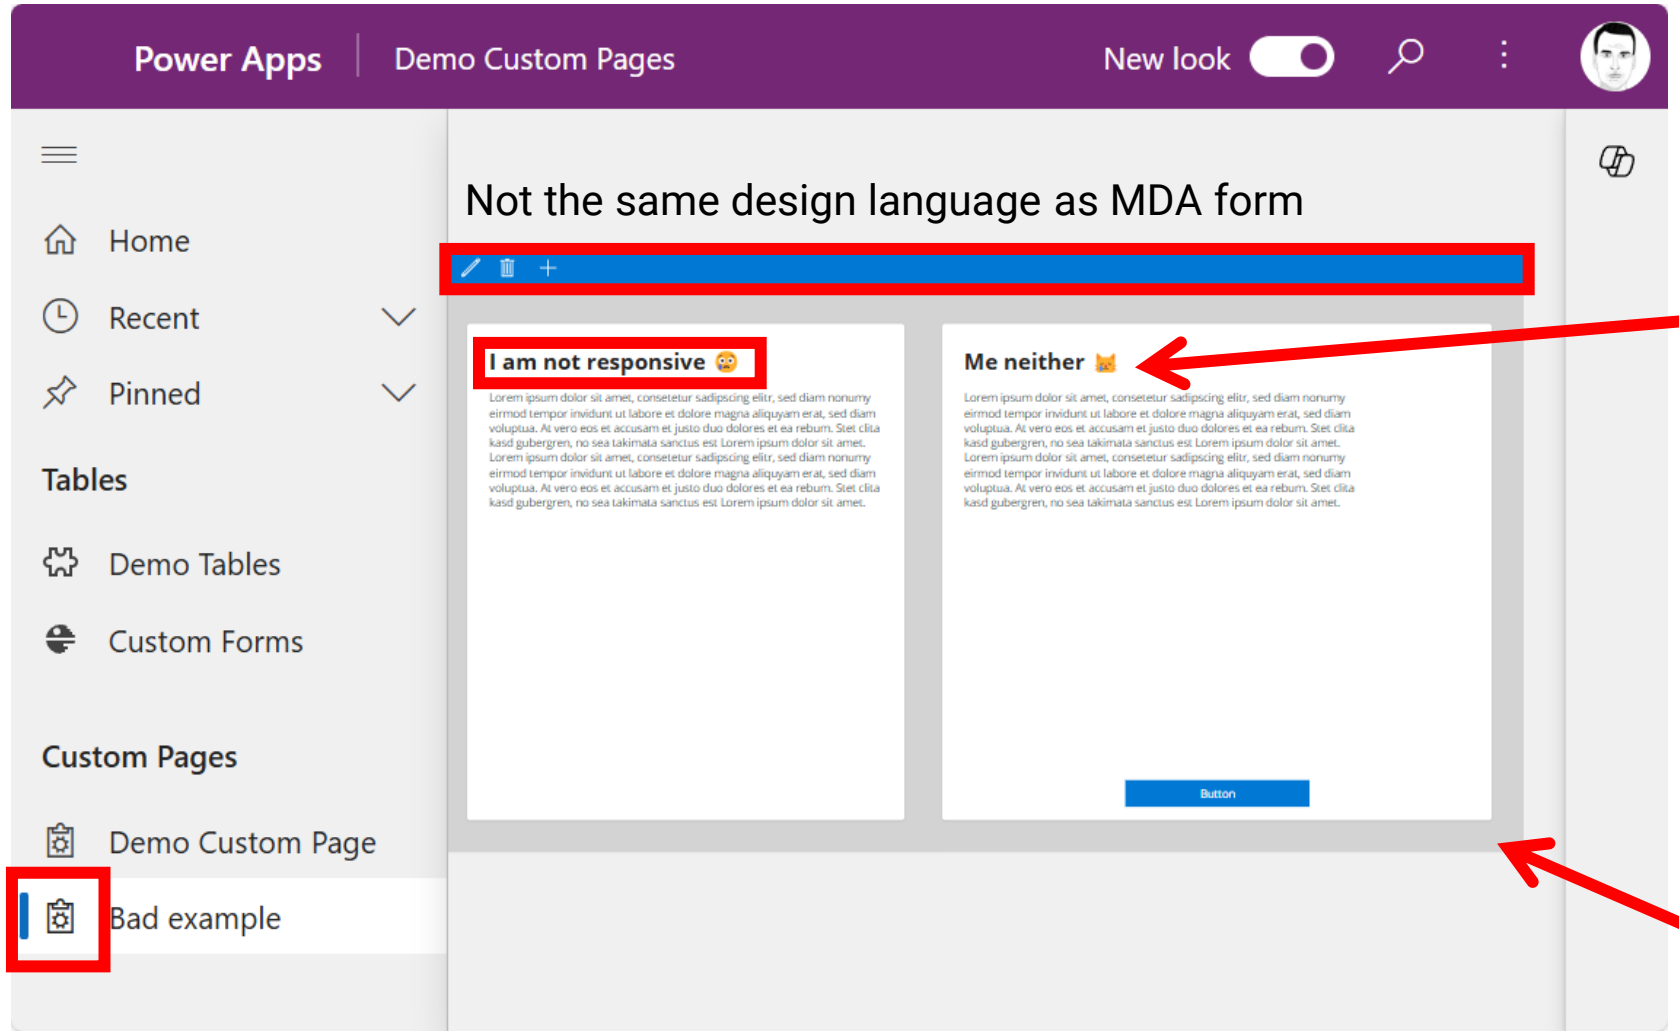


When to use Custom Pages

- Advanced Logic with Power FX instead of JS / Plugins
- PCF for unique User Experience
- Communicate with external APIs
- Connect to M365
- Trigger Power Automate

BUT: Code is still the best solution for some problems!

Bad example



Wrong font and headers too big

Wrong color

No icon

Creator Kit "Command Bar"
